DETAILED ACTION

Priority

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

Information Disclosure Statement

The information disclosure statement (IDS) submitted on 2/2/04 has been considered by

the examiner.

Claim Rejections - 35 USC § 112

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claim 6 is rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Claim 6 recites "said first pressure is applied during an entirely of step (b) and said bonding pressure is applied during an entirely of step (c)", which does not appear to be supported by the specification as filed.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

Art Unit: 1745

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 4-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Nezu et al., US 5,994,426.

Nezu teaches a fuel cell comprising a solid polymer electrolyte membrane and gas diffusion electrodes holding the membrane therebetween. The component parts of the fuel cell (includes membrane held between electrodes) were placed on a hot pressing machine whose temperature had been adjusted to 100°C in advance. The component parts were subjected to a pressure of 20 kgf/cm² at 100°C for 5 minutes. Then, further subjected to a pressure of 20 kfg/cm² at 132.5°C for 5 minutes. Then, further subjected to a pressure of 20 kfg/cm² at 165°C for 5 minutes. Thereafter, the pressure was increased to 80 kgf/cm² and was held thereat for 90 seconds (12:65-13:22). Oxygen and hydrogen gases were supplied to the fuel cell (13:32-34).

Thus the claims are anticipated.

Note the disclosed pressure of 20 kfg/cm² of Nezu is considered the "first pressure" of the claimed invention and the disclosed pressure of 80 kgf/cm² of Nezu is considered the "bonding pressure" of the claimed invention. Nezu teaches a temperature of 165°C, which is considered the "bonding temperature" of the claimed invention. The electrode assembly of Nezu inherently has "an initial temperature" before being subjected to heating.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Grot (US5,707,755) teaches a membrane electrode assembly is hot pressed to bond the electrodes to the membrane. For membrane electrode assemblies utilizing Nafion® as the

Art Unit: 1745

membrane, hot-pressing will typically be effected at a temperature of about 150C to about 200C and a pressure of about 200 to about 1000 psi (5:37-44).
